I. SPECIFICATIONS

1. MODEL: GX-400D

An asterisk next to a figure indicates the minimum guaranteed performance.

TRACK SYSTEM		4 track 2 channel stereo, monaural Recording/Playback
TAPE SPEED		15, 7-1/2 and 3-3/4 ips. $\pm 0.5\%$ (*1.5%)
WOW AND FLUTTER		Less than 0.035% (*0.06%) R.M.S. at 15 ips. Less than 0.05% (*0.09%) R.M.S. at 7-1/2 ips. Less than 0.08% (*0.15%) R.M.S. at 7-1/2 ips.
FREQUENCY RESPONSE	S.R.T. Tape	20 to 30,000 Hz (*30 to 27,000 Hz ± 3 dB) at 15 ips. 20 to 28,000 Hz (*30 to 24,000 Hz ± 3 dB) at 7-1/2 ips. 30 to 20,000 Hz (*30 to 17,000 Hz ± 3 dB) at 3-3/4 ips.
	Normal Tape	20 to 28,000 Hz (*30 to 24,000 Hz ± 3 dB) at 15 ips. 20 to 26,000 Hz (*30 to 22,000 Hz ± 3 dB) at 7-1/2 ips. 30 to 19,000 Hz (*30 to 15,000 Hz ± 3 dB) at 3-3/4 ips.
DISTORTION		*Less than 2% at 15 ips. 1,000 Hz "0" VU recording *Less than 2% at 7-1/2 ips. 1,000 Hz "0" VU recording *Less than 3% at 3-3/4 ips. 1,000 Hz "0" VU recording
OUTPUTS	Line Output Din Output Head Phone Output	0 ± 1 dB(O VU), 6 ± 1.5 dB(VR Max.) 390 mV 50 ± 10 mV 8 Ω load 1,000 Hz O VU Head Phone Volume maximum
INPUTS	Mic Input Line Input Din Input	0.7 mV 70 mV 15 mV(low), 300 mV(high)
RECORDING/PLAYBACK LEVEL		0 ± 1.5 dB
SIGNAL TO NOISE RATIO		Better than 54 dB (*48 dB)
CROSS TALK	Stereo Monaural	*Better than 45 dB at 1,000 Hz 3 VU recording Better than 70 dB *Better than 60 dB at 1,000 Hz 3 VU recording
ERASE RATIO		Better than 70 dB
RECORDING BIAS FREQUENCY		100 ± 5 kHz
BIAS LEAK	Stereo Monaural	Less than -30 VU Less than -20 VU
HIGH FREQUENCY DEVIATION		0 ± 1.5 dB, using a 15,000 Hz test tape at 15 ips.
REVERSING TIME		Within 4 sec. at 15 ips. Within 3 sec. at 7-1/2, 3-3/4 ips.
RECORDING CAPACITY		90 min. stereo recording, using a 3,600 ft. tape at 15 ips.
F.FWD AND RWD TIME		120/100 sec., using a 2,400 ft. tape at 50/60 Hz
MOTORS	Capstan Motor Reel Motor	4 pole eddy current A.C. servo motor Type: SCM3-16TW Revolutions: 800 r.p.m. at 15 ips. 400 r.p.m. at 7-1/2 ips. 200 r.p.m. at 3-3/4 ips. Two 6 pole eddy current inner rotor motors Type: IM1-24TW Revolutions: 1,000/1,200 r.p.m. at 50/60 Hz
HEADS	Combo Recording/ Erase Head Playback Head	Type: RE4-6 Gap: 3.5 to 5.5 microns(Rec.) 0.2 mm x 2 W Gap(Erase) Impedance: 1,400 Ω $\pm 25\%$ at 100 kHz(Rec.) 130 Ω $\pm 7\%$ at 100 kHz(Erase) D.C. Resistance: 5.5 Ω Rec.(approx.) 2.3 Ω Erase(approx.) Type: P4-220 Gap: 0.5 to 2 microns Impedance: 1.2 k Ω $\pm 25\%$ at 1 kHz D.C. Resistance: 160 Ω (approx.)

DIMENSIONS	457(W)x590(H)x258(D) mm (18"x23.2"x10.2")	
WEIGHT	30.5 kg(67.2 lbs.)	

NOTE: Specifications subject to change without notice.

II. MEASURING METHOD

1. TAPE SPEED DEVIATION

Fig. 1

As shown in Fig. 1, connect a Frequency Counter to the Line output of Model GX-400D. Playback a 1,000 Hz pre-recorded test tape. Take a Frequency Counter reading at the beginning, middle, and end of tape winding during playback. The maximum value of these respective readings will represent tape speed deviation.

2. WOW AND FLUTTER

Fig. 2

Method A

As shown in Fig. 2, connect the Line output of Model GX-400D to the input of a Wow and Flutter Meter. Playback a 3,000 Hz pre-recorded test tape and take a Wow and Flutter Meter reading at the beginning, middle, and end of tape winding. The maximum value of these respective readings will represent the Wow and Flutter.

Method B

Supply a 3,000 Hz sine wave signal from an Audio Frequency Oscillator and make a recording on a blank tape at the beginning, middle, and end of tape winding. Rewind and playback the resultant signal. Measure Wow and Flutter with a Wow and Flutter Meter. (The Wow and Flutter value of Method B will be close to $\sqrt{2}$ times of value of Method A.)

3. FREQUENCY RESPONSE

Fig. 3

For measuring Frequency Response, connect instruments as shown in Fig. 3 and proceed as follows:

- 1) Supply a 1,000 Hz sine wave signal to the Line input of Model GX-400D from an Audio Frequency Oscillator through an Attenuator.
- 2) Set recorder to recording mode and turn recording level control volume to maximum. Adjust Attenuator to obtain a 0 dB V.T.V.M. reading.
- 3) Under conditions described in 2) above, readjust Attenuator so that the Line output is -20 dB, and record 30 to 27,000 Hz spot frequencies.
- 4) Rewind tape and playback from the beginning. Take V.T.V.M. spot frequency readings and plot values on a graph.

NOTE: When measuring Frequency Response, new tape should be used.

4. SIGNAL TO NOISE RATIO

Fig. 4

As shown in Fig. 4, connect a High Sensitivity V.T.V.M. to the Line output of Model GX-400D. Playback a 700 Hz "0" VU pre-recorded test tape and measure the output. Then remove the tape and measure the noise level under the same condition. Convert each of the measured values into decibels.

5. TOTAL HARMONIC DISTORTION

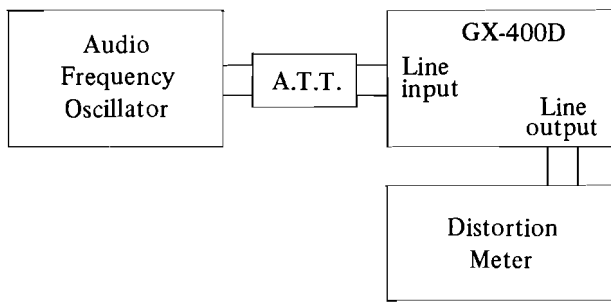

Fig. 5

Connect the measuring instruments as shown in Fig. 5 and record a 1,000 Hz sine wave signal at "0" VU. Playback the resultant signal and measure the overall distortion factor.

- NOTE: 1) At this time, Distortion of the Audio Frequency Oscillator must be sufficiently small.
2) When measuring the distortion factor, new tape should be used.

6. CROSS TALK (Cross talk between the tracks)

Fig. 6

As shown in Fig. 6 first record a 1,000 Hz sine wave signal on track No. 3 at +3 VU level. Next, record under a non-input condition. Then playback the tape on track No. 3 and 1' (reversed condition of tape) through the B.P.F. (1,000 Hz Band Pass Filter, sensitivity 1,000 Hz, ratio 1:1) and obtain the ratio from the following formula.

$$C = 20 \log \frac{E_0}{E_2 - E_1} \quad (\text{dB})$$

- where, C = Desired cross talk ratio (dB)
 E_0 = 1,000 Hz signal output level (V)
 E_2 = 1,000 Hz cross talk level (V)
 E_1 = Non-input cross talk level (V)

7. ERASE RATIO

Fig. 7

As shown in Fig. 7 using a virgin tape first record a 1,000 Hz sine wave signal on track No. 3 at +3 VU level, then playback this recorded signal and take a V.T.V.M. reading at the output level. Next, erase this recorded portion and playback the erased part through the B.P.F. (1,000 Hz sensitivity 1:1) and take readings of the erased signal. Obtain a ratio between the two from the following formula:

$$E_r = 20 \log \frac{E_0}{E_2 - E_1} \quad (\text{dB})$$

- where, E_r = Desired erase ratio
 E_0 = 1,000 Hz signal output level (V)
 E_2 = Erased 1,000 Hz signal and noise level (V)
 E_1 = Erased noise level (V)

NOTE: When measuring cross talk and erase ratio virgin tape should be used.

III. DISMANTLING OF UNIT

In case of trouble, etc. necessitating disassembly, please disassemble in the order shown in photographs. Reassemble in reverse order.

IV. MECHANISM ADJUSTMENTS

Fig. 8

Fig. 9

1. FLYWHEEL LOOSE PLAY ADJUSTMENT

Adjust by inserting an Adjusting washer (U type) at the places indicated in Fig. 8 to obtain a 0.1 to 0.3 mm loose play when the flywheel is moved in the direction of the arrow shown in Fig. 9.

NOTE: When the flywheel is replaced, replace only with one of the same rank.

Fig. 10

Fig. 11

Fig. 12

2. BRAKE SOLENOID POSITION ADJUSTMENT

- 1) As shown in Fig. 11, press brake micro switch as far as it will go toward the top of the mechanical frame, and tighten screws A and B.
- 2) Move the Right Brake Band Prop shown in Fig. 10 so that the gap between Brake Lever A and the body of Brake Micro Switch is 5 to 6 mm (See Fig. 11).
- 3) Move the Left Brake Band Prop shown in Fig. 10 so that Brake Lever B and Brake Lever A are simultaneously operated by Brake Lever C.
- 4) As shown in Fig. 12, when the plunger is pulled, tighten Brake Solenoid Screws C and D at position at which the gap between Brake Lever A and the body of Brake Micro Switch is 0.5 mm at the narrowest place.

Fig. 13

3. BRAKE TENSION ADJUSTMENT

- 1) As shown in Fig. 14, brake tension is measured with a spring gauge using a 60 mm diameter tape wound on a 5" reel. Ideal brake tension is 650 ± 50 gr, and left/right deviation allowance should be within 50 gr.
- 2) Methods for brake tension adjustment are as follows: (See Fig. 13)
 - Method A: Change position of suspended spring.
 - Method B: Adjust position of spring suspension metal.

NOTE: Following Brake Tension Adjustment, confirm that when the machine is set to each of the various modes (except stop mode), the brake band separates from the cloth tape on the brake drum by at least 0.5 mm. (See Fig. 13)

Fig. 14

Fig. 15

Fig. 17

Fig. 16

4. PINCH ROLLER SOLENOID POSITION ADJUSTMENT

Set nut so that the screw part of the pull bar extends 5 mm further than the nut, and insert a space gauge of which the dimensions are the same as shown in Fig. 16 between the collar and pull bar shown in Fig. 15, and fix at position at which the pinch roller rests against the capstan. Set left and right to same degree.

5. SHIFTER SOLENOID POSITION ADJUSTMENT (See Fig. 17)

Adjust the position of the Shifter Solenoid so that when the plunger is pulled, the gap of the shifter and oblong hole of the head base is 0.8 to 1.5 mm.

NOTE: The tape must definitely not touch the head.

Fig. 18

6. PINCH ROLLER PRESSURE ADJUSTMENT (See Fig. 18)

As shown in Fig. 18, pull back the Pinch Roller with a spring scale, and then return. Take a reading of the spring scale indication at the time the pinch roller touches the capstan. Adjust Pinch Roller Pressure Adjustment nut to obtain a 1.2 kg±50 gr spring scale indication at this time.

NOTE: Because this model employs a dual capstan system, adjust so that the difference in pinch roller pressure between left and right is within 50 gr.

Fig. 19

Fig. 20

7. REEL TABLE HEIGHT ADJUSTMENT
(See Fig. 19)

Load a tape (left and right reel tables), but do not thread tape through left/right tape guides and tension levers. Set to F.Fwd, and Rwd mode and adjust the position of reel tables in direction of arrow mark so that the tape winds in the center of the reels. Tighten reel table fixation screws at most ideal position.

8. TAPE GUIDE HEIGHT ADJUSTMENT
(See Fig. 20)

Thread tape over left and right tape guides, but do not thread over left and right tension levers. Loosen tape guide fixation screws and adjust left and right tape guide height adjustment nuts so that at Fwd and Rev modes, the tape runs on the center of the tape guides. Tighten tape guide fixation screws to maintain this condition.

NOTE: Tape should wind in center of reel regardless of type of reel used.

Fig. 21

Fig. 22

Fig. 23

9. TENSION LEVER HEIGHT ADJUSTMENT
(See Fig. 21)

Thread tape over left and right tension levers and over the left and right tape guides properly. Adjust tension lever height by inserting an Adjusting washer (U type) as shown in Fig. 21 so that at Fwd and Rev modes, the tape travels on the center of the tape guide.

NOTE: The right hand side tape guide is shown in Fig. 21, but when making the left hand side tension lever height adjustment, the screw on the left is used to make the tape guide higher, and the screw on the right is used to make the tape guide lower.

10. CONFIRMATION OF POINT AT WHICH LEFT AND RIGHT TENSION ARMS OPERATE

Confirm that the left and right micro switches operate at the positions indicated in Fig. 22.

11. TENSION ARM RETURN TENSION ADJUSTMENT

Bend the oval shaped lug terminal and adjust the strength of coil spring so that as shown in Fig. 23, when the tension arm returns in the direction of the arrow the tension registered with a tension gauge is 6 to 7 gr.

VII. RECORDING EQUALIZER AND A.D.R. ADJUSTMENTS

Fig. 33

Fig. 34

Fig. 35

Fig. 36

- As shown in Figs. 33 and 35, disconnect the ground side wires connected to multi plug recording head, and connect a 10Ω fixed resistor in series between the ground wires as shown in Fig. 34.
- As shown in Fig. 36, connect a High Sensitivity V.T.V.M. to both terminals of the 10Ω fixed resistor.
- Temporarily remove the emitter resistor of Oscillator P.C. Board Transistors TR2, 3 (GX-400D) or TR1, 2 (GX-400D PRO), and set deck to recording mode (Bias Voltage is not supplied to Recording Head).
- Turn ADR Adjustment semi-fixed resistor of Rec. Amp. P.C. Board fully clockwise as shown in Fig. 30. Set Rec. Equalizer Adjustment semi-fixed resistor to 12 o'clock position, and depress SOURCE Button. (ADR does not function)
- Set tape speed to 3-3/4 ips, and Tape Selector to NORMAL.
- Supply a 1,000 Hz signal to the Line Input from an audio frequency oscillator, and adjust Recording Level Adjustment volume to obtain a -50 dB V.T.V.M. indication: (This voltage furnishes the 1,000 Hz OVU recording signal current.)
- Switch to 10,000 Hz frequency, and with Equalizer Adjustment volume, set the 10,000 Hz voltage to -41 dB. (Set 10,000 Hz to +9 dB in relation to 1,000 Hz)
- In case of Model GX-400D, set machine to FWD and REV modes in Steps 6 and 7.
- Next, set frequency to 15,000 Hz (GX-400D) or 20,000 Hz (GX-400D PRO), turn ADR Adjustment volume counter-clockwise until the 15,000 Hz voltage is -43dB (or the 20,000 Hz voltage is -45 dB).

NOTE: When making adjustment in Item 9, in case of model GX-400D, the machine can be set to either FWD or REV mode.

- It is advisable to paint lock Equalizer and ADR Adjustment semi-fixed resistors following adjustment.

Frequency Level Setting According to Model Number

Frequency	1,000 Hz	10,000 Hz	15,000 Hz	20,000 Hz
Model				
GX-400D	-50 dB	-41 dB		-45 dB
GX-400D PRO	-50 dB	-41 dB	-43 dB	

Chart 5

VIII. EXPLANATION

OF A.C SERVO CONTROL OPERATION

1. CIRCUIT OPERATION (Refer to Schematic Diagram)

- 1) The A.C. signal which is generated at the detector coil by capstan motor revolutions passes the high pass filter (H.P.F.) and is supplied to the base of TR3.

*It is necessary for the signal generated at the detection coil to pass the H.P.F. because of a hum element included in the signal caused by the 50/60 Hz power source frequency and pulsive noise.

- 2) At 15 ips motor revolutions, because the A.C. signal generated at the detector coil is a limited level signal of about 800 mVp-p, 1,500 Hz frequency, it is amplified at TR3, 4 until the waveform of the signal is clipped.
- 3) One of the TR4 output signal enters the differential circuit unchanged and the minus signal is cut at D2. The other output signal is amplified and phase inverted at TR5 and then enters the differential circuit and the minus signal is cut at D3. These two signals are composited at D2, D3 cathodes and becomes twice the frequency generated at the detector coil.
- 4) The signal composited at Diodes D2, D3 is supplied to the base of TR6 as the TR6, TR7 one-shot multi vibrator trigger signal.
- 5) While the one-shot multi vibrator is stabilized, TR6 is turned off, TR7 is turned on, and no signal is emitted at TR7 collector.
- 6) When the positive trigger enters the base of TR6, and TR6 is turned on, TR7 "OFF", the one-shot multi vibrator reverses. TR7 collector voltage increases, and at the same time the charge current which has passed VR2, R59 (at 15 ips) flows to C10. When C10 electrical potential increases and TR7 is turned on, the collector voltage decreases. This operation is repeated by means of the trigger signal to TR6, and accordingly, a pulse output waveform is emitted at TR7 collector.
- 7) TR7 output is pulse regulated at TR8, TR9 and supplied to the integrated circuit and the output from the integrated circuit is supplied to the base of TR10.
- 8) Because the level of the signal which passed the integrated circuit is small, it is amplified at TR10, TR12, TR13.
- 9) Because the ripple part of the collector output signal from TR13 is considerable, it is further passed through the integrated circuit and supplied to the base of TR17.
- 10) TR17 and Power Transistor TR2 is conversion darlington connected, and TR2 is driven by TR17 emitter current and the impedance of TR2 between C-E is changed.

- 11) The supply voltage to the capstan motor is changed by the change in impedance between C-E of TR2 and the motor torque is also changed. At this time, a certain load is applied to the capstan motor. However, the voltage applied to the motor is changed according to this load. Therefore, the load is balanced with the torque and stabilized revolutions are maintained.

2. SPEED ADJUSTMENT SYSTEM

(Refer to Schematic Diagram)

- 1) In case the capstan motor revolutions become fast, the output signal frequency of the one-shot multi becomes high, the first integrated circuit output rises, TR10 is turned on further and the collector voltage decreases. When TR10 collector voltage is lowered, TR12 base bias decreases, and TR12 collector voltage rises. When TR12 collector voltage increases, TR13 collector output decreases and the second integrated circuit output voltage decreases. Consequently, TR17 base drive also decreases and the resistance between C-E of Power Transistor TR2 increases, the supply voltage to the motor decreases and the motor torque declines and capstan motor revolutions are reduced.
- 2) On the other hand, if the capstan revolutions become slow, the output signal frequency of the one-shot multi becomes low, the first integrated circuit output is lowered, TR10 is turned almost off, and the collector voltage increases. When TR10 collector voltage is increased, TR12 base bias increases, and TR12 collector voltage declines. When TR12 collector voltage decreases, TR13 collector output increases and the 2nd integrated circuit output voltage increases. Consequently, TR17 base drive also increases and the resistance between C-E of Power Transistor TR2 decreases, the supply voltage to the motor increases and the motor torque rises and capstan motor revolutions are increased.

Fig. 37

3. RETARDER CIRCUIT OPERATION

When the Tape Speed Switch is switched from 15 ips to 7-1/2 ips, or from 7-1/2 ips to 3-3/4 ips, capstan motor revolutions are quickly decreased, and in a short time, established motor revolutions are attained.

- 1) When tape speed is switched from to 15 ips to 7-1/2 ips while switching is taking place, 15 ips revolutions are momentarily retained. The one-shot multi time constant becomes longer and the output pulse width wider. Consequently, the first integrated circuit output increases and in case the revolutions slightly increase over the aforementioned established revolutions, the D.C. amp. operates in the same way as explained above.
- 2) Accordingly, TR13 collector output decreases, and passes the 2nd stage integrated circuit. TR14 is turned off, TR15 "ON" and TR16 "ON". The collector current flow to relay at TR15 collector load, and the relay operates.
- 3) When the relay functions, the capstan motor sub coil is grounded, and an A.C. half wave flows as shown in the Fig. 37. The current within the negative half wave does not flow to Diode D4. The power generated at the sub coil passes the D3→main coil→sub coil closed circuit as shown in the Fig. 37. Consequently, a D.C. magnetic field is formed and braking is applied to the rotor of the motor.
- 4) When capstan motor revolutions decrease, the voltage necessary for normal revolutions appears at TR13 collector and TR14 is turned on. Also proper bias is applied to the base of TR17 and current flows to the motor through D2→TR2→D3→motor coil; motor coil→D1→TR2→D4, and normalized motor revolutions are attained.

IX. A.D.R. (AUTOMATIC DISTORTION REDUCTION) OPERATION

Fig. 41 A.D.R. BLOCK DIAGRAM

Fig. 42

Fig. 43

1. The A.D.R. Block Diagram is as shown in Fig. 41, and A.T.T. is comprised of R_1 and Z_0 .
2. Z_0 impedance is the composite impedance of Z_1 of which the impedance is changed by the frequency and Z_2 which is changed depending upon the signal level. (See Figs. 42, 43)
3. Z_1 impedance resonates at recording equalizer peak point in the vicinity of f_0 (see Fig. 44). At resonance time the impedance of Z_1 is minimum.
4. When a flat and wide frequency band width signal is introduced to the Line Input, it is amplified at Amp. 1 and Amp. 2 and supplied to the recording head.
5. Regarding the flow of signal current to the Rec. Head, as shown in Fig. 44 when comparing the high with the low, the high flow of current is rather large.
6. Accordingly, in attempting to record at a high level, as shown in Fig. 44, there is a relative increase in the recording equalizer level as well, and there are instances in which the saturation level of the magnetic tape is surpassed at the equalizer peak.
7. At this time, as shown in Fig. 41, the Amp. 2 output passes the H.P.F., is amplified at Amp. 3, and this output is rectified at the diodes.
8. The voltage rectified at the diodes is supplied to the F.E.T. drain. Therefore, the impedance between gate & source is lowered and Z_0 impedance is also lowered. However, because at the resonance point vicinity of the recording equalizer Z_1 impedance is minimum, R_1 and Z_0 A.T.T. operates only at high range frequencies.
9. The high range frequency level is decreased at the input stage of Amp. 1 by means of A.T.T. composed of R_1 and Z_0 , and after passing Amp. 1 and Amp. 2, the recording current supplied to the recording head, as shown in Fig. 44, becomes below the saturation level of the magnetic tape in the vicinity of f_0 and the signal can be recorded on the magnetic tape without distortion.

HOW TO USE THIS PARTS LIST

1. This parts list is compiled by various individual blocks based on assembly process.
2. When ordering parts, please describe parts number, serial number, and model number in detail.
3. How to read list.

Ref. No.	Parts No.	Description	Schematic No.	Q'ty
FLYWHEEL BLOCK #13				
12-115x	800425	Flywheel Block Assy. Comp.	RDG #13	1
12-116	244506	Flywheel Only	RD-233	1
12-117x	244754	Felt, Flywheel	RD-275	1
12-118	251324	Main Metal Case	RD-236	1
12-119	253080	Main Metal	RD-237	1

4. The symbol numbers shown on the P.C. Board list can be matched with the Composite Views of components of the Schematic Diagram or Service Manual.
5. The indications of Resistors and Capacitors in the photos of P.C. Board are being eliminated.
6. The shape of the parts and parts name, etc. can be confirmed by comparing them with the parts shown on the Electrical Parts Table of P.C. Board.
7. Both the kind of part and installation position can be determined by the Parts Number. To determine where a parts number is listed, utilize Parts Index at end of Parts List.
It is necessary first of all to find the Parts Number. This can be accomplished by using the Reference Number listed at right of parts number in the Parts Index. (meaning of ref. no. outlined in Item 3 above).
8. Utilize separate "Price List for Parts" to determine unit price. The most simple method of finding parts Price is to utilize the reference number.

ELECTRICAL PARTS TABLE

<p>Because the indication of resistors and capacitors in the P. C. Board photos are being eliminated, please confirm parts name and shape by comparing them with the parts shown in this table.</p>	<p>1  Solid Resistor</p>	<p>2  Carbon Resistor</p>	<p>3  Metal Oxide Film Resistor</p>
<p>4  Cement Resistor</p>	<p>5  Wire-Wound Resistor</p>	<p>6  Thermister</p>	<p>7  Enamel Resistor</p>
<p>1  MP Capacitor (Tubular Type)</p>	<p>2  Plastic Capacitor</p>	<p>3  Mylar Capacitor</p>	<p>4  VFM (Hi-Q) Capacitor</p>
<p>5  Mylar Capacitor</p>	<p>6  Tantalum Capacitor</p>	<p>7  Oil Capacitor (Tubular Type)</p>	<p>8  Styroil Capacitor</p>
<p>9  Electrolytic Capacitor (Tubular Type)</p>	<p>10  Electrolytic Capacitor</p>	<p>11  Ceramic Capacitor</p>	<p>12  Metalized Mylar (Paper) Capacitor</p>
<p>13  Trimmer Condenser</p>		<p>VR  Semi-Fixed Volume</p>	
<p>L  Ferri Inductor</p>	<p>TR  Transistor</p>		
<p>CR  Spark Quencher</p>	<p>D  Diode (Silicon, Zener, Germanium)</p>
